ABSTRACT

A cord holder for the storage and transport of electrical cords and similar items comprising a concave pouch open at both ends with a girth wider than the end openings. In use, a bundled or coiled cord is pulled into the device by an arm entering the device through one opening, extending through the device and out the second opening. The bundled cord is grasped by the extended hand and pulled into the device through the second opening. The cord is released after entering the device and expands. It is then held inside by expanding and filling the wider midsection.
